Motivation

Problem Formulation

Model Description

Experiments and Results

▲□▶ ▲圖▶ ▲≣▶ ▲≣▶ = 差 = のへで

Motivation

- 1. Lack of official orthographic system for many languages in the world
- 2. Lack of lexical-level and word-level transcriptions for training ASR systems for majority of existing languages, e.g., Mboshi
- 3. Link between low-resource speech learning and early language acquisition process: Information sources besides speech (e.g., vision and taste)?

Multimodal Word Discovery

Inputs:

- 1. $x_1, \ldots, x_{\mathcal{T}_x}, x \in \mathcal{X}$: phone sequences that the infant hears
- 2. $y_1, \ldots, y_{T_y}, T_y < T_x, y \in \mathcal{Y} \cup \{NULL\}$: a set of image concepts that the infant sees
- Output:
 - 1. Alignment matrix: word unit = consecutive alignments to the same concept

$$A \in [0,1]^{T_x \times T_y} = [\mathsf{a}_1^\top, \dots, \mathsf{a}_{T_x}^\top]^\top = [\tilde{\mathsf{a}}_1 \dots \tilde{\mathsf{a}}_{T_y}]$$

Assumptions:

- 1. One concept per phone: $\sum_{i=0}^{T_y} a_{ti} = 1, t = 1, \dots, T_x$
- 2. Unaligned phones: $a_{t0} = 1$

Motivation

Problem Formulation

Model Description

Experiments and Results

SMT vs NMT

- Statistical Machine Translation (SMT): first introduced by Brown et. al. 1993 [1]
 - 1. Learning goal: $p(x|y) = \sum_{A \in \{0,1\}^{T_y \times T_x}} p(A|y)p(x|y,A)$
 - 2. Inference: EM algorithm, iteratively computing $p(x_t|y_i)$ in terms of the expected counts:

$$\langle c(\mathbf{x}_t|\mathbf{y}_i;\mathbf{x},\mathbf{y})\rangle := \mathbb{E}_{\mathsf{A}}[\delta_{i(t)i}|\mathbf{x},\mathbf{y}]$$

3. Output: hard alignment $i(t) := \arg \max_i p(a_{ti} = 1 | x, y)$

- Neural Machine Translation (NMT) with attention: introduced by Bahdanau et. al. 2014 [2]:
 - 1. Learning goal: $p(y|x) \approx p(y|x, A^*)$ (dominant path assumption)
 - 2. Inference: backpropagation + batched gradient descent
 - 3. Output: soft alignment α_{ti}

Models: Machine Translation

"Boys in blue polo shirts"

NMT Attention Mechanism

1. Normalize-over-time model (Bahdanau et. al., [2]):

$$a_{it}^* := \alpha_{it} = \frac{\exp(e_i(\mathsf{h}(\mathsf{x}_t),\mathsf{s}_{i-1})/T)}{\sum_{j=1}^{T_x} \exp(e_j(\mathsf{h}(\mathsf{x}_t),\mathsf{s}_{j-1})/T)}$$

2. Normalize-over-concept model:

$$a_{it}^* := \alpha_{it} = \frac{\exp(e(h(x_t), y_i)/T)}{\sum_{j=1}^{T_y} \exp(e(h(x_t), y_j)/T)}$$

Motivation

Problem Formulation

Model Description

Experiments and Results

Dataset Extraction

- Raw data: Flickr8k and Flickr30k with object bounding boxes and phrase-level boundaries; English as "simulated" low-resourced language
- 2. Image concept extraction: merge similar noun phrases Flickr30kEntities using Wordnet synsets and select concepts with frequency > 10
- 3. Utterances selection: captions with all image labels having frequencies > 10, \approx 8000 captions in total
- 4. Caption transcription: transcribe text into phone sequence via CMU dictionary

5. Dataset split: same test set as in (Karpathy 2014)

Model parameters

- SMT: initialized counts with indicator for co-occurences
- NMT: written with XNMT toolkit [3]; 512-dimensional embedding layer, 512-dimensional one-layer BLSTM encoder and LSTM decoder, 512-dimensional fully-connected attention; 0.5 dropout

Results

		NMT	NMT
	SMT	(norm. over	(norm. over
		concepts)	time)
Word-IoU	6.00	46.0	21.0
Accuracy	43.8	23.0	41.5
Recall	52.9	18.0	29.2
Precision	46.7	12.1 33.0	
F-Measure	49.6	14.5	31.0

	Recall@1	Recall@5	Recall@10
SMT	9.42%	21.1%	29.1%
Harwath&Glass [4]	-	-	17.9%
Karpathy [5]	10.3%	31.4%	42.5%

Analysis - ROC Curve

- ROC curve: visualize tradeoff between false positive and true positive rate for one-versus-all classification of concepts
- Rougher transition from SMT; higher variances from NMT

Figure: ROC plot for SMT

Figure: ROC plot for NMT

Analysis - Soft Alignment Plots

- Soft alignment matrix: A T_x × T_y matrix with each entry as p(a_{ti} = 1|x, y) for SMT and attention weights for NMT
- "A woman is sitting at a desk near to a window that has a huge picture of a hand painted on it"

Figure: Left: SMT, Middle: normalized-over-concept, Right: normalized-over-time

Conclusion and Future Works

- 1. SMT performs superior to NMT on our low-resource multimodal setting
- 2. SMT learns meaningful units from image concepts
- 3. Future directions: multimodal word discovery beyond mixture models; word discovery with raw audio and image
